

## **About Company – Brief Summary**

Genesis Water Technologies designs, manufactures and supplies integrated sustainable water treatment solutions focused on meeting our clients water quality challenges through innovation and collaboration. We work with industrial partners, government and non governmental agencies, experienced civil engineering and contracting partners, and other specialized companies throughout the world that share our vision and values.

## **GWT Green Communities Program Initiative**

Genesis Water Technologies has developed a specialized green community program initiative.

This green community program has been recently featured on a well respected TV program, Emerald Planet that is broadcast in over 80 nations.

These green community program initiative originated out of the necessity of several governmental agencies across the world to find a sustainable infrastructure solution to provide basic services of drinking water, waste water, and power to coastal communities where there was no existing infrastructure available.

This program is continuing to evolve into a solution that has been well received by communities and governments in both developed and developing nations to address the areas of sustainability, water quality, and water scarcity, which are major challenges that they are faced with today and into the future.

The community projects were initially developed based on coastal communities with populations of 4000-8000 or more people.

We have expanded this concept to include inland communities close to surface water sources such as a river.

In these communities, Genesis Water Technologies and our partners are providing a renewable energy grid using both specialized solar photovoltaic technology as well as biogas/syngas technology to power not only modular water and waste treatment infrastructure, but also electricity to power homes and small businesses in these communities. This hybrid approach will provide continuous sustainable

power to meet the needs of each community.

Through the renewable syngas process, we are also able to achieve organic solid waste reduction.

This reduces the area required for landfills for waste and reduces the associated operating costs of maintaining these facilities in these communities.

Genesis Water Technologies and our partners look forward to replicating this community program throughout the world.

Together we can make a difference in this mission to save lives and enhance economically productive communities as well as efficiently optimize industrial processes in a sustainably environmentally friendly way for mutual benefit.

### **How to Engage:**

Steps to get started:

- ⤴ Discuss Initial Scope with government officials/Interest Level (About 6 initial questions)
- ⤴ Work with local partner and government officials to approve a design budget (This budget would include the cost of local civil engineering/site plan and GWT site visits)
- ⤴ Implementation Budget- Budget for equipment solutions- (local contracting budget for construction with GWT oversight)
- ⤴ GWT technical support/consumable agreements with government agencies to be facilitated in association with local GWT partner to maintain all systems in optimal operation.
